

Baggage Handling Process SIPOC Map

Strategic Analysis: Baggage Handling Process Optimization

Key Subsystems: Conveyor & Handling System, Loader Belt System, Scanner (ATR) System, Baggage Tracking Database

Major Risk Areas: Conveyor malfunction, sorter errors, tag scanner failure, human error, data mismatch, adverse weather

Focus for Improvement: Ensure accurate tagging, equipment reliability, proper procedures, staff training, and real-time tracking data accuracy

Environment/Mother Nature) or service-specific categories.

1. Machine (Conveyor and Handling System)

Conveyor Malfunction: Belt jams or failures.

Sorter Errors: Mechanical malfunction of sorters leading to wrong, misrouted, or lost bags.

Tag Scanner Failure: Automatic tag readers (ATRs) failing to read barcode tags.

2. Method (Processes and Procedures)

Inadequate Transfer Time: Too little time for baggage to be moved between flights.

Unloading/Loading Miscalculation: Errors in the loading process (e.g., in the F8 turn-on of the loader belt).

Irregularity in Processing: Failure in following the baggage handling flow.

3. Man (Personnel and Staff)

Human Error: Misreading tags, wrong tagging at check-in, or incorrect loading at the aircraft.

Training Deficiencies: Inadequate skills to operate sorting systems.

4. Material (Baggage and Labels)

Damaged/Missing Labels: Missing, torn, or unreadable baggage tags.

Overloaded Bag: Tag detaching from overstuffed luggage.

5. Measurement (Information Systems)

Data Mismatch: Failure in the baggage information system, where the tag does not match the scanning records.

System Tracking Issues: Baggage tracking data missing or incorrect in the tracking information database.

6. Mother Nature (Environment)

Adverse Weather: Severe weather conditions causing ground operations to stop, delaying or misrouting bags.

Subsystem Focus (Baggage Handling System):

The analysis often focuses on the conveyor belt system, loader belt, and manual handling during loading/unloading. The largest number of connections to failure often occurs in the baggage tracking database and scanner subsystem, which ensures the bag matches the passenger's itinerary
